

Daily Assessment format

Date: 20/July/2020

Course: Basic statistics

Topic: introduction

GitHub repository: jyoti-courses

Name: Jyoti S Bonure

Urn: 4AL17EC037

Report

Understanding statistics is essential to understand research in the social & behavioural sciences. In this course you will learn the basics of statistics; not just how to calculate them, but also how to evaluate them. This course will also prepare you for the next course in the specialization - the course inferential statistics.

In the first part of the course we will discuss methods of descriptive statistics. You will learn what cases & variables are & how you can compute measures of central tendency (mean, median & mode) & dispersion (standard deviation & variance). Next, we discuss how to assess relationships b/w variables, & we introduce the concepts correlation & regression.

The second part of the course is concerned with the basics of probability; distributions & sampling distributions. You need to know about these things in order to understand how inferential statistics work.

The third part of the course consists of an introduction to methods of inferential statistics - methods that help us decide whether the patterns we see in our data are strong enough to draw conclusions about the underlying population we are interested in. We will discuss confidence intervals & significance tests.

You will not only learn about all these statistical concepts, you will also be trained to calculate & generate these statistics yourself using freely available statistical software.
